

## ANSWERS

### Climate Change

long-term changes in the Earth's climate, or a region on Earth  
includes more than just the average surface temperature, for example, variations in the amount of snow, sea levels, and sea ice can all be consequences of climate change  
occurs naturally apart from human activity  
Includes temperatures getting lower

### Global Warming

an increase in the Earth's average surface temperature from human-made greenhouse gas emissions  
is the result of human activity  
temperatures get higher

### Both Climate Change and Global Warming

Both can change the Earth's climate  
Both can involve temperature changes
